

3-case

An experiment was conducted in second grade. The students had to make Christmas decorations at home. Children in class “A” had to give the toys they made to the teacher, in class “B” they had to give them to the head of the class, in group “C” they had to simply put them in a common box. Will the productivity be the same? In which group will the task be completed better, what is the reason for this?
